■ Reference Value

Item	Value	Note
Battery life	7 years min. with continuous input at 25°C (lithium battery)	The battery life is calculated according to the conditions in the left column and therefore is not a guaranteed value. Use these value as reference for maintenance or replacement.

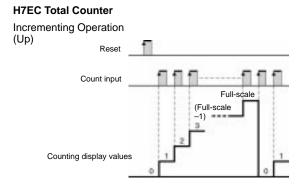

Nomenclature -

Note: Perform switch setting before mounting to a control panel.

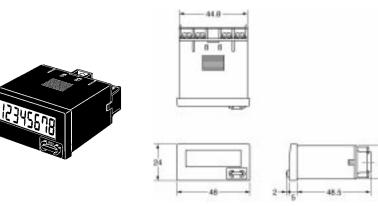

Operation -

Operating Modes

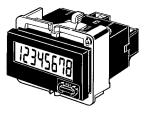

Dimensions

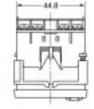

Note: All units are in millimeters unless otherwise indicated. **H7EC-N**

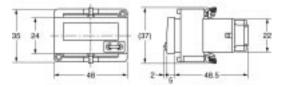

Dimensions with Flush Mounting Bracket

Panel Cutout Separate mounting

Waterproofing is not possible for joint mounting

- When mounting, insert the Counter into the cutout, insert the adapter from the back and push in the Counter while making the gap between the front panel and the cutout panel as small as possible. Use screws to secure the Counter. If waterproofing is desired, insert the waterproof packing.
- When several Counters are installed, ensure that the ambient temperature will not exceed specifications.
- The appropriate thickness of the panel is 1 to 5 mm.

Backlight Model

No-backlight Model

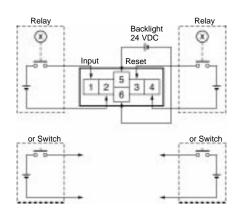

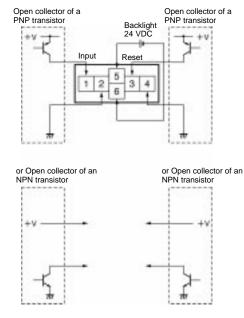

Connections H7EC Total Counter

PNP/NPN Universal DC Voltage Input Model With Backlight

1. Contact Input (Input by a Relay or Switch Contact)

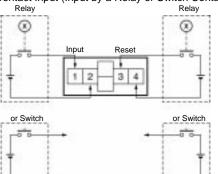

2. Solid-state Input

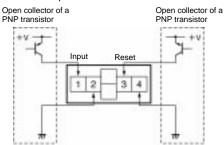

- **Note:** 1. Terminals 2 and 4 (input circuit and reset circuit) are functionally isolated.
 - 2. Select input transistors according to the following: Dielectric strength of the collector ≥ 50 V Leakage current < 100 μ A

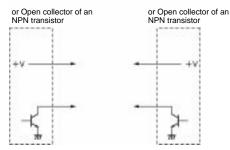

PNP/NPN Universal DC Voltage Input Model Without Backlight

1. Contact Input (Input by a Relay or Switch Contact)

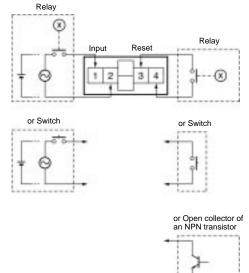

2. Solid-state Input

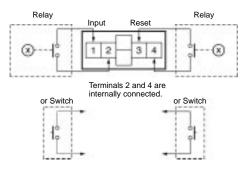

- **Note:** 1. Terminals 2 and 4 (input circuit and reset circuit) are functionally isolated.
 - Select input transistors according to the following: Dielectric strength of the collector ≥ 50 V Leakage current < 100 μA

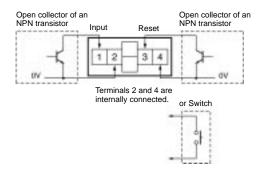

- No-voltage Input Model
 - 1. Contact Input (Input by a Relay or Switch Contact)

- Note: 1. Use Relays and Switches that have high contact reliability because the current flowing from terminals 1 or 3 is small. It is recommended that OMRON's G3TA-IA/ID be used as the SSR.
 - 2. Solid-state Input (Open Collector Input of an NPN Transistor)

- Note: 1. Residual voltage in the output section of Proximity Sensors or Photoelectric Sensors becomes less than 0.5 V because the current flowing from terminals 1 or 3 is small thus allowing easy connection.
 - 2. Select input transistors according to the following: Dielectric strength of the collector $\ge 50 \text{ V}$ Leakage current < 1 μ A

Note: Select input transistors according to the following: Dielectric strength of the collector $\ge 50 \text{ V}$ Leakage current < 1 μ A

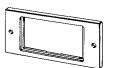

Accessories (Order Separately)

New H7E (Except for PCB-mounting Counter)

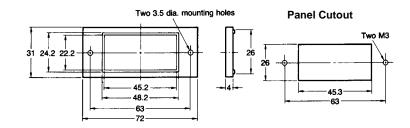

The New H7E models are supplied with a mounting bracket and nut. Additionally, the Flush Mounting Adapters shown here allow the New H7E models to be fitted to existing panel cutouts.

Y92F-75 Flush Mounting Adapter

for 26 \times 45.3 Rectangular Cutout Use mounting bracket supplied with the Counter

Precautions -

New H7E (Except for PCB-mounting Counter)

This product has a built-in lithium battery. Do not short-circuit the + and – terminals, charge, disassemble, deform, or expose the battery to fire. The battery may explode (break), catch fire, or cause liquid leakage.

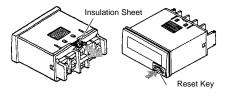

🗥 Caution -

Do not use any battery other than the specified one (Y92S-36). Using another battery may cause liquid leakage or breakage, resulting in malfunction or injury.

Before Use

 An insulation sheet has been inserted to maintain the quality of the Totalizer in the event of a long period without use. Be sure to remove this sheet before attempting to use the product.
 Remove the insulation sheet and press the Reset Key on the

front panel of the Counter. (With the H7ER-N,-NV(-H),-NV1(-H), models, "0" or "0.0" will be displayed after 1 s.)

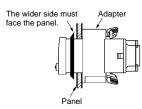

- Switch settings on the Counter must be performed before mounting it to a control panel.
- Do not use the Counter in the following locations:
 - · Locations subject to severe changes in temperature.
 - Locations subject to condensation as the result of high humidity.

Mounting Precautions for Flush Mounting

Although the operating section is watertight (conforming to NEMA4, IP66), rubber packing is provided to avoid water leakage through the gap between the Counter and panel cutout. Unless this rubber packing is tightly squeezed on, water may permeate inside the panel. Therefore, be sure to tighten the screws for fixing the Flush Mounting Bracket. (Excessive tightening may also deform the rubber packing.)

Screw for the Flush Mounting Bracket

✓! Caution

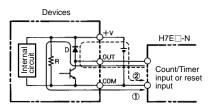

If a voltage other than the rated one is applied, internal elements may be damaged.

Do not use the Counter in the following places:

- Locations subject to direct sunlight.
- Locations subject to corrosive gases.
- Locations subject to dust.

Reset Input and Count/Timer Input

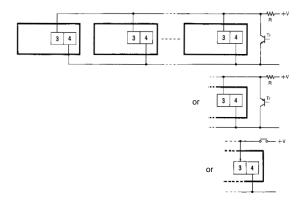

• The H7E operates using its built-in Battery. If the H7E is connected to a device that has +V and OUT terminals that are connected with a diode as shown in the circuit diagram, the circuit indicated by the arrow 1 or 2 will be formed when the device is turned OFF. As a result, the H7E may be reset or count by one. It is recommended that such devices not be connected to the H7E.

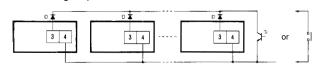

- If an excessive voltage is applied to the count/timer input or reset input terminals, the internal elements may be damaged. Ensure that the following voltages are not exceeded:
 - PNP/NPN universal voltage input model: 30 VDC
 AC/DC voltage input model:
 - At count/timer input: 240 VAC (peak voltage: 338V) 240 VDC
 - At reset input: 3 VDC (no-voltage input)
 - No-voltage input model: 3 VDC
 - Avoid wiring close to high-tension or large-current lines.
- Do not remove the outer case when voltage is being applied to the power supply terminals or the input terminals.
- The input for the H7E_-NFV-_ is a high-impedance circuit and so influence from an induced voltage may result in malfunction. Therefore, when the input signal wiring is longer than 10 m (line capacitance of 120 pF/m, at room temperature), it is recommended that a CR filter or a bleeder resistor is connected.

Count/Timer Input or Reset Input to More than One H7E Counter at a Time

PNP/NPN Universal DC Voltage Input

- Note: H (Reset ON) level must be 4.5 V minimum. 4.7 (kΩ)/N + V H = 4.7 (kΩ)/N + R
- No-voltage Input

- Note: 1. The leakage current of the transistor used for input must be less than 1 µA.
 - 2. The forward voltage of the diode must be as low as possible (i.e., 0.1 V maximum with an I_F of 20 μ A) so that the voltage between terminals 3 and 4 will be 0.5 V when the reset input is ON.

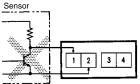

Input and Power Supply

No-voltage Input Models

• Do not impose voltage on the Counter if the Counter is a model that operates with no-voltage input, otherwise the internal circuit of the Counter may be damaged.

Do not connect any single input signal in parallel to Counter models operating with no-voltage input and those operating with voltage input, otherwise the Counters may malfunction.

When connecting a sensor to the Counter that operates with no-voltage input, make sure that the sensor has open collector output.

When connecting an open collector input from a transistor to the Counter that operates with no-voltage input, make sure that the leakage current of the transistor is 1 µA maximum.

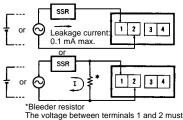

No-voltage Input and PNP/NPN Universal DC Voltage Input Models

The operation of the Counter may be affected if the line voltage of the power supply exceeds 500 pF (about 10 m, with parallel wires of 2 x 2 mm).

Keep all wires as short as possible. When using shielded wire, line capacitance may occur.

AC/DC Multi-voltage Input Models

When connecting count/timer input from an SSR to the Counter that operates with AC/DC voltage input, use OMRON's G3TA-IA/ID SSR (for DC) whose leakage current is 0.1 mA max. or connect a bleeder resistor in parallel to the input circuit of the Counter.

The voltage between terminals 1 and 2 must be 1.5 V maximum when the SSR is OFF

Backlight Power Supply

To reduce variation in the brightness of the backlight when using more than one H7E with a backlight, use the same power supply for all the backlights.

5	 5	5
1	 	

When connecting the DC power supply for the backlights, be sure to connect the polarities correctly.

Input Verification with the H7ET Time Counter

(When the time range is not set to 0s to 999h59m59s)

The decimal point of the LCD blinks every other second while an input signal is being applied. If the decimal point is not blinking, the input signal is not being received correctly. Check the input signal connections.

Unit Label for Time Counter and Tachometer

A unit label has been packed with the Counter. Use in accordance with the application.

Battery Replacement

Remove the wiring when replacing the Battery. Do not come in contact with any item to which high voltage is being applied. Doing so may result in electric shock.

Before changing the Battery, the person should ensure that they are not carrying any static electric charge.

Procedure for replacing the Battery (refer to the diagrams below):

- 1. Using the tool, pry open the lift-tab on the case. (1)
- 2. Pull the body out of its outer case. (2)
- 3. Lift the Battery up by the edge and remove it. (3) When removing the Battery, do not come in contact with the display area or any internal parts.

- 4. Wipe the back of the new Battery before inserting it.
- 5. Ensure that the + and terminals are correctly oriented.
- After replacing the Battery, re-insert the body into its case. (4) Check that the case is securely held in by the lift-tab.
- 7. Press the Reset Key before use (not necessary for H7ER-N,-NV,-NV1). (5)

Tool (1) (1) (1) (3) (4) (4) (4) (5)

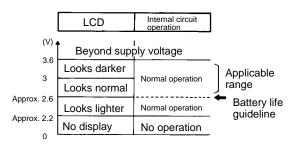

Precautions

PCB-mounting Counter Power Supply

 Use the power supply within the applicable range indicated by the following waveform, while considering the ripple and voltage fluctuations of the circuit power source.

• The H7E -N P changes its mode as shown below depending on the applied supply voltage.

EN/IEC Standards

The count or timer input, reset input, and backlight power supply terminals of the no-voltage input or PNP/NPN universal DC voltage input models (H7E -N,-N1, H7E -NV(-H),-NV1(-H)) are not isolated.

A SELV power supply conforming to Appendix H of IEC61010-1 should be used for the count or timer input, reset input and backlight power supply terminals. A SELV power supply is a power supply for which the input and output have double or reinforced insulation, and for which the output voltage is 30 Vrms with 42.4 V peak or 60 VDC max. (Only the H7E \Box -NV \Box -H has a backlight.)

The terminals for count or timer input and reset input for AC/DC multi-voltage input models have basic insulation.

Connect the reset input terminals to a device that does not have exposed current-carrying parts and has basic insulation for 240 VAC.

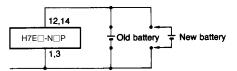

Others

If the indicator keeps flickering or is OFF, the internal battery may be close to the end of its service life. In such a case, it is suggested that the battery be replaced.

Battery Replacement

To prevent unwanted reset when replacing the battery, connect the new battery before disconnecting the old one. Otherwise, the voltage supplied to the counter circuit drops, causing the present count value to reset.

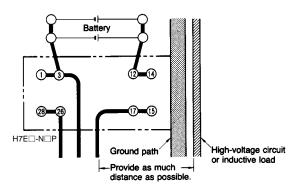

When designing the circuit board, providing two extra terminals for battery connection will make the switch must simpler. See the schematic diagram below:

Wiring polarity must be carefully observed, in order to prevent permanent damage to the Counters. Exercise caution when inserting the Counter in the socket, to prevent reversed polarity.

Inputs

Do not route the wiring of the count, timer, or reset inputs in the vicinity of, or in parallel to the wiring of high-voltage or inductive load circuits (such as motors and relays). Also, keep the wiring as short as possible.

Be careful not to apply voltages exceeding the following values to the count, timer, or reset terminals, otherwise the internal circuit may be damaged.

No-voltage input: 3 VDC

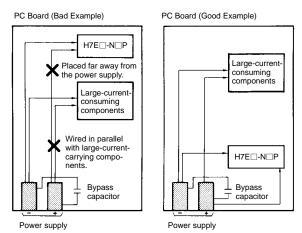

General Information

The terminals are solder-plated. Finish soldering the terminals within 5 seconds, at a solder iron tip temperature of $250^\circ C\pm 10^\circ.$

Since the Counter is not flux-tight, do not use flux when soldering. Avoid automatic and dip soldering. Manually solder the Counter onto a PC board, and avoid cleaning as much as possible.

When mounting the Counter on a PC board with components which consume higher current than the H7E \Box -N \Box P, observe the following precautions.

- 1. Minimize the wiring (less than 50 mm) from the H7E□-N□P to the power supply section.
- 2. Avoid placing the H7E -N P power, timer, counter, or reset input circuit in parallel with circuits that consume large currents, particularly on the positive side.

When using the Counter in an environment where the Counter is subject to frequent occurrences of vibration or shock, or when mounting the Counter facing downwards or sideways, it is suggested that the Counter be directly soldered to a PCB instead of using sockets.

To Conform to EN/IEC Standards

Input terminals have no insulation from power supply terminals. The power supply terminals must be supplied from a SELV source in accordance with IEC61010-1 Annex H. SELV (separated extra-low voltage) source is a power supply having double or reinforced insulation between the primary and the secondary circuit and having output voltage of 30 V rms max. and 42.4 V peak max. or 60 VDC max.

Cleaning

To prevent damage, the exterior of the Counter must not be exposed to organic solvents (3.g. paint thinner or benzine), strong alkalis, or strong acids.

Others

- No user-serviceable parts.
- Return to OMRON for all repairs.
